

# Agglomeration Economies

## Urban Economics

Ignacio Sarmiento-Barbieri

Universidad de los Andes

September 23, 2024

# Agenda

- 1 Motivation
- 2 Duranton and Overman
- 3 Aside: A Primer on Density Estimation
  - Parametric vs nonparametric methods
  - Parametric Methods
  - Non-parametric methods
    - Non-parametric methods: The Histogram
    - Non-parametric methods: the naive estimator
    - Non-parametric methods: Rosenblatt-Parzen density estimation approach
- 4 Duranton and Overman: Again

# Agglomeration Economies

- Why do we see such a remarkable clustering of human activity in a small number of urban areas?

# Evidence of Agglomeration Economies

- ▶ Three strategies to identify agglomeration economies
  - 1 Show there is too much spatial concentration to be random (Duranton and Overman, 2005)
  - 2 Compare productivity over space (Greenstone et al., 2010)
  - 3 Compare wages and rents across space (Quantitative Spatial Models, Ahlfeldt et al, 2015)

# Agenda

- 1 Motivation
- 2 Duranton and Overman
- 3 Aside: A Primer on Density Estimation
  - Parametric vs nonparametric methods
  - Parametric Methods
  - Non-parametric methods
    - Non-parametric methods: The Histogram
    - Non-parametric methods: the naive estimator
    - Non-parametric methods: Rosenblatt-Parzen density estimation approach
- 4 Duranton and Overman: Again

# Spatial Concentration

## Extremes of Localization and Dispersion

(c) Other Agricultural and Forestry  
Machinery (SIC2932)

(d) Machinery for Textile, Apparel and  
Leather Production (SIC2954)

# Spatial Concentration

## Ambiguous Cases

(a) Basic Pharmaceuticals  
(SIC2441)

(b) Pharmaceutical Preparations  
(SIC2442)

## 1 Select Relevant Establishments:

- ▶ Choose establishments based on industry and size.
- ▶ Consider different thresholds to assess robustness (e.g., include only those contributing to 90% of employment).

## 2 Compute Bilateral Distances:

- ▶ Calculate Euclidean distances between all pairs of establishments.
- ▶ Use Kernel Density Estimation (KDE) to estimate the density of these distances.

# Spatial Concentration

## K Density Estimates

(c) Other Agricultural and Forestry Machinery (SIC2932)

(d) Machinery for Textile, Apparel and Leather Production (SIC2954)

**Figure 2.** K-density, local confidence intervals and global confidence bands for four illustrative industries

# Spatial Concentration

## Ambiguous Cases

(a) Basic Pharmaceuticals  
(SIC2441)

(b) Pharmaceutical Preparations  
(SIC2442)

## 4 Generate Counterfactuals:

- ▶ Randomly assign establishments to locations, maintaining the number of establishments and industrial concentration.
- ▶ Create 1,000 simulations to construct a baseline for comparison.

## 5 Statistical Significance:

- ▶ Compare actual densities with simulated counterfactuals to determine if localization is significant.
- ▶ Use local and global confidence intervals to assess statistical significance of localization.

## 6 Localization Metrics:

- ▶ Define indices for localization ( $\gamma$ ) and dispersion ( $\psi$ ) at each distance.
- ▶ Determine global localization or dispersion based on these indices over all distances.

# Agenda

## 1 Motivation

## 2 Duranton and Overman

## 3 Aside: A Primer on Density Estimation

- Parametric vs nonparametric methods
- Parametric Methods
- Non-parametric methods
  - Non-parametric methods: The Histogram
  - Non-parametric methods: the naive estimator
  - Non-parametric methods: Rosenblatt-Parzen density estimation approach

## 4 Duranton and Overman: Again

# Agenda

- 3 Aside: A Primer on Density Estimation
  - Parametric vs nonparametric methods
  - Parametric Methods
  - Non-parametric methods
    - Non-parametric methods: The Histogram
    - Non-parametric methods: the naive estimator
    - Non-parametric methods: Rosenblatt-Parzen density estimation approach
- 4 Duranton and Overman: Again

# Univariate density estimation: parametric vs nonparametric methods

- ▶ Let  $f = f(\cdot)$  be the density function of the random variable  $X$
- ▶ Let  $x_1, x_2, \dots, x_n$  be a random sample of  $X$ . Then,  $x_i \sim f$  iid
- ▶ How can we estimate the density in a particular point  $x_0$ , then  $f(x_0)$ ?

# Agenda

- 1 Motivation
- 2 Duranton and Overman
- 3 Aside: A Primer on Density Estimation
  - Parametric vs nonparametric methods
  - Parametric Methods
  - Non-parametric methods
    - Non-parametric methods: The Histogram
    - Non-parametric methods: the naive estimator
    - Non-parametric methods: Rosenblatt-Parzen density estimation approach
- 4 Duranton and Overman: Again

# Parametric methods

- ▶ They assume a particular functional form for  $f$ .

# Parametric methods

- ▶ They assume a particular functional form for  $f$ .
- ▶ Example:

$$f(x_o) = \phi(x_o) = \frac{1}{\sigma\sqrt{2\pi}} \exp \left[ -\frac{1}{2} \left( \frac{x_o - \mu}{\sigma} \right)^2 \right] \quad (1)$$

# Agenda

- 1 Motivation
- 2 Duranton and Overman
- 3 Aside: A Primer on Density Estimation
  - Parametric vs nonparametric methods
  - Parametric Methods
  - **Non-parametric methods**
    - Non-parametric methods: The Histogram
    - Non-parametric methods: the naive estimator
    - Non-parametric methods: Rosenblatt-Parzen density estimation approach
- 4 Duranton and Overman: Again

# Non-parametric methods

- ▶ They seek to estimate  $f(x_0)$  without assuming a particular functional form, only assuming certain regularity conditions of the density (smoothness, differentiability)

# A rudimentary non-parametric estimator: the histogram

- The height of the bars is an estimator of the density at any point in the interval

$$\hat{f}(x_0) = \frac{\text{Nber. obs interval}}{n \times w} \quad (2)$$

# Histogram problems: (1) depends on starting point

# Histogram problems: (2) depends on the bandwidth

# Histogram problems: (2) depends on the bandwidth

## Histogram problems: (3) is discontinuous at the ends of the interval

- Note that  $\hat{f}(x_1) = \hat{f}(x_2)$
- But  $\hat{f}(x_2 + \epsilon) = \frac{1}{4} \hat{f}(x_2)$  for any  $\epsilon > 0$

# Another non-parametric estimator: the naive estimator

## Discrete case

- ▶  $X$  is a discrete RV, *iid*
- ▶ Objective: estimate  $\Pr(X = x_o) = f(x_o)$
- ▶ The naive estimator comes from:

$$\hat{f}(x_o) = \frac{\# x_i = x_o}{n} = \frac{1}{n} \sum_{i=1}^n I(x_i = x_o) \quad (3)$$

# Another non-parametric estimator: the naive estimator

## Continuous case

- ▶  $X$  is a continuous RV ( $\Pr(X = x_0)$ ) we evaluate the probability that  $X$  is "close" to  $x_0$ .
- ▶ We say that  $x_i$  is close to  $x_0$  if  $x_i$  belongs to the interval  $(x_0 - h, x_0 + h)$

# The naive estimator

Notice:

- ▶ Every possible point  $x_o$  is the center of an interval
- ▶ Observations that are within that interval (less than one  $h$  away from  $x_o$ ) are weighted by  $1/2$

# The naive estimator

Notice:

- ▶ To estimate the density at points  $a$ ,  $b$  and  $c$  we construct intervals around them
- ▶ Then, unlike what happens in the histograms, the intervals of the naive estimator overlap (the initial point no longer matters)

# The naive estimator

## Problems

- It depends on  $h$ : the larger the bandwidth, the more distant observations from  $x_0$  are used to estimate  $f(x_0)$ . The higher  $h$ , the smoother the estimated density ( $h$ =smoothing parameter)

- The weight  $1/2I(\cdot)$  is discontinuous at the limits of each interval, generating discontinuities in the estimated density.
- The weight treats observations very close to  $x_0$  in the same way as others somewhat further away, as long as they belong to the interval of length  $2h$  around  $x_0$

# The weighted average estimator or kernel method

- ▶ The kernel estimator is a generalization of the naive estimator that overcomes some of the deficiencies of the latter.
- ▶ The weight  $1/2I(.)$  of the naive estimator is replaced by a new weight  $K(.)$ :

$$\hat{f}(x_0) = \frac{1}{n \times h} \sum_{i=1}^n K\left(\frac{x_i - x_0}{h}\right) \quad (4)$$

- ▶ Rosenblatt-Parzen density estimation approach

# The weighted average estimator or kernel method

► The weights or kernels are known functions that satisfy:

1  $K(\phi) \geq 0$

2  $\int_{-\infty}^{\infty} K(\phi) d\phi = 1$

3  $K(\phi) = K(-\phi)$

4  $E(K(\phi)) = 0$

# The weighted average estimator or kernel method

## Example 1: rectangular or uniform kernel

$$K(\phi) = \begin{cases} \frac{1}{2} & |\phi| < 1 \\ 0 & o.w. \end{cases} \quad (5)$$

where  $\phi = \frac{x_i - x_0}{h}$  In this case, the Kernel estimator matches the naive estimator. Note that the weight is similar to a uniform density function on the interval  $(-1, 1)$

# The weighted average estimator or kernel method

## Example 1: rectangular or uniform kernel

# The weighted average estimator or kernel method

## Example 2: Gaussian kernel

### ► Gaussian

$$K(\phi) = \frac{1}{\sqrt{2\pi}} e^{-\phi^2/2} \quad (6)$$

- The kernel function corresponds to the standard normal density function that satisfies the above assumptions.
- For this type of kernel, the density estimator is given by:

$$\hat{f}(x_0) = \frac{1}{n \times h} \sum_{i=1}^n \frac{1}{\sqrt{2\pi}} e^{-\left(\frac{x_i - x_0}{h}\right)^2/2} \quad (7)$$

- Important: we don't assume normal distribution for any variable. The functional form is just used to weight the sample observations

# The weighted average estimator or kernel method

## Example 2: Gaussian kernel

# The weighted average estimator or kernel method

Example 2: Gaussian kernel (smaller h)

# The weighted average estimator or kernel method

## Other Kernels

Kernel type	Formula	Support
Gaussian or normal	$\frac{1}{\sqrt{2\pi}} \exp(-\varphi^2 / 2)$	$\varphi \in (-\infty, \infty)$
Epanechnikov	$\frac{3}{4\sqrt{5}} (1 - \frac{1}{5}\varphi^2) I( \varphi  < \sqrt{5})$	$\varphi \in (-\sqrt{5}, \sqrt{5})$
Epanechnikov modificado	$\frac{3}{4} (1 - \varphi^2) I( \varphi  < 1)$	$\varphi \in (-1, 1)$
Triangular	$(1 -  \varphi ) I( \varphi  < 1)$	$\varphi \in (-1, 1)$
Uniform or rectangular	$\frac{1}{2} I( \varphi  < 1)$	$\varphi \in (-1, 1)$

# The weighted average estimator or kernel method

## Properties: Bias

- ▶ The kernel estimator is generally biased.
- ▶ The approximate expression for the bias is given by:

$$\text{bias}[\hat{f}(x_o)] \approx \frac{h^2}{2} f''(x_o) \int_{-\infty}^{\infty} K(\phi) \phi^2 d\phi \quad (8)$$

- ▶ The approximate expression for the asymptotic variance of the kernel estimator is given by:

$$\text{variance}[\hat{f}(x_o)] \approx \frac{1}{n \times h} f(x_o) \int_{-\infty}^{\infty} K^2(\phi) d\phi \quad (9)$$

# The weighted average estimator or kernel method

## Bandwidth Selection

$$MSE(\hat{f}(x)) = Var(\hat{f}(x)) + \left(bias(\hat{f}(x))\right)^2 \quad (10)$$

# The weighted average estimator or kernel method

## Bandwidth Selection

$$MSE(\hat{f}(x)) = Var(\hat{f}(x)) + \left(bias(\hat{f}(x))\right)^2 \quad (10)$$

- We obtain a bandwidth which globally balances bias and variance by minimizing MSE with respect to  $h$ , i.e.,

$$h_{opt} = \left( \frac{\int K^2(z)dz}{(\int z^2 K(z)dz)^2 \int f'(x)^2 dx} \right)^{-1/5} n^{-1/5} \quad (11)$$

# The weighted average estimator or kernel method

## Bandwidth Selection

- ▶ There are two popular approaches to bandwidth selection,
  - 1 Rules-of-thumb,

# The weighted average estimator or kernel method

## Rule-of-Thumb

- ▶ The rule-of-thumb for choosing the bandwidth makes assumptions about  $f$  and  $K$
- ▶ For example: under a gaussian density and kernel

$$h_{opt} = 1.059\sigma n^{-1/5} \quad (12)$$

# The weighted average estimator or kernel method

## Bandwidth Selection

- ▶ There are two popular approaches to bandwidth selection,
  - 1 Rules-of-thumb,
  - 2 cross-validation methods,
